- Show your reasoning and calculations and always explain your answers.

Physical constants and useful formulae

$$e = 1.61 \times 10^{-19} \,\mathrm{C}$$
 $q_{\mathrm{electron}} = -e$ $q_{\mathrm{proton}} = +e$ $m_{\mathrm{electron}} = 9.11 \times 10^{-31} \,\mathrm{kg}$ $m_{\mathrm{proton}} = 1.67 \times 10^{-27} \,\mathrm{kg}$ $k = 9.0 \times 10^9 \,\mathrm{Nm}^2/\mathrm{C}^2$ $\epsilon_0 = 8.85 \times 10^{-12} \,\mathrm{C}^2/\mathrm{Nm}^2$

Question 1

In a procedure to coat an object with copper, copper ions flow through a solution and accumulate on the object. Each copper ion has the same charge as two protons. The current (consisting of copper ions) is 0.025 A. Determine the total number of copper ions that accumulate on the object in 30 minutes.

Let N be number of ions and
$$q$$
 charge on each. Then $\Delta Q = Nq = D$ $Nq = T\Delta t = 0$ $N = T\Delta t$

Here $q = 2e$ gives

 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$
 $N = T\Delta t = 0.025 A \times 30 \text{min} \times 60 \text{s/min}$

Two capacitors are connected to a battery as illustrated.

a) Determine the charge across each capacitor.

The potential difference is the same for each.

$$\triangle Q = C, \Delta V$$

= $25 \times 10^{-9} F \times 10V = 2.5 \times 10^{-7} C$

For 2

$$Q_2 = C_2 \Delta V$$

= $50 \times 10^{-9} F \times 10V = 5.0 \times 10^{-7} C$

+5 b) Determine the total energy stored in the pair of capacitors.

For 1

$$U_1 = \frac{1}{2} \frac{Q_1^2}{c_1} = \frac{1}{2} C_1 (\Delta V_1)^2 = 0 \quad U_1 = \frac{1}{2} 25 \times 10^{-9} \, \text{F} \times (10 \, \text{V})^2$$

$$= 1.25 \times 10^{-6} \, \text{J}$$

 $25\,\mathrm{nF}$

For 2

$$U_2 = \frac{1}{2} C_2 (\Delta V_2)^2 = \frac{1}{2} 50 \times 10^{-9} F \times (10V)^2 = 2.5 \times 10^{-6} J$$

The total energy is
$$U = U_1 + U_2$$

 $U = 3.75 \times 10^{-6}$ /10

Resistors, labeled 1, 2, and 3, are connected to an ideal battery as illustrated. The resistances are $R_1 = 5\Omega$ and $R_2 = R_3 =$ $20\,\Omega$. Let P_1 be the power produced by resistor 1, P_2 the power produced by resistor 2 and P_3 the power produced by resistor 3. Which of the following (choose one) is true?

for each resistor

ii)
$$P_2 = P_3 < P_1$$

iii)
$$P_2 = P_3 > P_1$$

iv)
$$P_1 = P_2 < P_3$$

$$(v) P_1 < P_2 < P_3)$$

$$V_1$$
 V_2 V_3 V_4 V_5 V_6 V_7 V_8 V_8 V_8 V_8 V_9 V_9

$$= IR$$
$$= I^{2}R$$

The current from the ballery sphits. Iz is larger than I, since resistance on right is less than on lesh

Then P27P,

since currents are some and RZZR,

B(§

γ

Question 4

A battery and identical bulbs are connected in the illustrated circuit. Rank the bulbs in order of increasing brightness. Explain your answer.

Power only depends on current since P-IR2 and resistances are all equal.

The resistance of the A,B,C,D combination

The current that flows loft all passes through A but splits at B. SO A is brighter than B. C.D.

At B more current flows right since R is lower, So D is brighter than B.C. The last two are equal since they are in soies.

/6

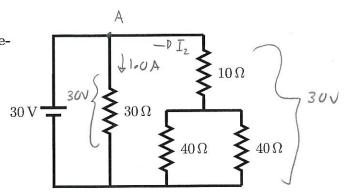

&Iz

 $\sqrt{5}$

Determine the current that flows through each resistor and the battery in the illustrated circuit.

There are two parallel arms whose voltages are each 30V.

Across the 30R resistor $\Delta V = IR = 0$ 30V = I30R = 0 I = 1.CA

Now consider the remaining combination: $\begin{cases}
\frac{1}{30} I_{2} \\
\frac{1}{30} I_{2}
\end{cases}$ \begin{cases}

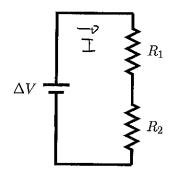

This is equivolent to

1	resistor	current
	30 R	1.CA + 3
	102	1-0A] 13
) 40R	0.51
	40R	0.5A +43
1	battery	2.0A
5		

So here $I_z=1.0A$ again. This flows through the 101 resistor This splits evenly at the two 401 resistors ND 0.5A in each At the junction A, $I_{in}=1.0A+1.0A=2.0A$ 12.42 Thus current in battery 18 2.0A /15

Two resistors, with resistances R_1 and R_2 , are connected to a battery as illustrated. The battery provides potential difference ΔV .

a) Derive an expression for the current (in terms of R_1, R_2 and ΔV) that flows through each resistor in the illustrated circuit.

$$\Delta V = I Req$$
 $Req = R_1 + R_7$

$$=0 \quad \Delta V = I(R_1 + R_2) = 0 \quad I = \frac{\Delta V}{R_1 + R_2}$$

The current in each resistor is the same. So
$$I = \frac{\Delta V}{R_1 + R_2}$$

b) Derive an expression for the potential difference (in terms of R_1, R_2 and ΔV) across the resistor with resistance R_1 in the illustrated circuit.

$$\Delta V_{1} = I R_{1}$$

$$= \frac{\Delta V}{R_{1} + R_{2}} R_{1} = \sum_{i} \Delta V_{i} = \frac{R_{1}}{R_{1} + R_{2}} \Delta V$$
+3

c) Determine the ratio R_1/R_2 such that the potential difference across the resistor with resistance R_1 is one third of the potential difference provided by the battery.

We need
$$\Delta V_1 = \frac{1}{3} \Delta V$$
 +6
$$= 0 \qquad \frac{R_1}{R_1 + R_2} \Delta V = \frac{1}{3} \Delta V$$

$$R_1 = \frac{1}{3} R_1 + \frac{1}{3} R_2$$

$$\frac{2}{3} R_1 = \frac{1}{3} R_2 = 0 \qquad R_1 / R_2 = \frac{1}{2}$$
/12

A heater is designed to produce 1200 W of power when connected to a 120 V outlet. Assuming that the heater obeys Ohm's law, determine the resistance of the heater.

$$P = I\Delta V \quad \text{and} \quad I = \Delta V/R$$

$$= 0 \quad P = (\Delta V)^{2}/R = 0 \quad R = \frac{(\Delta V)^{2}}{P} = \frac{(120V)^{2}}{1200W} = 12.\Omega$$

Rod A

Rod B

Question 8

Two metal rods are connected to a battery as illustrated. The cylinders have the same lengths and also the same radius. The resistivity of rod A is five times that of rod B. Which of the following (choose one) is true regarding the currents through the rods?

In series currents are same

ii) $I_{\rm in\ A}=25\,I_{\rm in\ B}$

everywhere.

iii)
$$I_{\text{in A}} = 5 I_{\text{in B}}$$

iv)
$$I_{\text{in A}} = \frac{1}{5} I_{\text{in B}}$$

/5

Question 9

Three identical resistors are connected to a battery as illustrated in the following circuit. Which of the following (choose one) is the equivalent resistance of the portion of the circuit within the box?

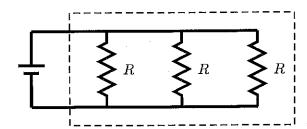

$$\widetilde{\text{ii}}$$
 $R_{\text{eq}} = R/2$

iii)
$$R_{eq} = R$$

iv)
$$R_{\rm eq} = 2R$$

v)
$$R_{\rm eq} = 3R$$

$$\frac{1}{Rq_{x}} = \frac{1}{R} + \frac{1}{R} = \frac{3}{R}$$

$$= 0 \quad Reg = R/3$$
