

# Hamilton's Equations

Skip 7.6, 7.7, 7.8, 7.9

One can show conditions for conservation of Energy, momentum, and angular momentum

Let us derive the Hamiltonian

$$H = \sum_j p_j \dot{q}_j - L$$

If the generalized coordinates are independent of time and  $U$  is not a function of time or velocity

$$\text{Then } H = T + U = E.$$

This is different than saying  $E = \text{constant}$

$$x = v_0 t + \frac{1}{2} a t^2 + \ell \sin \theta$$

$$\dot{x} = v_0 + a t + \dot{\theta} \ell \cos \theta \quad U = -m g \ell \cos \theta$$

$$y = -\ell \cos \theta$$

$$\dot{y} = \ell \dot{\theta} \sin \theta$$

$$L = \frac{1}{2} m (v_0 + a t + \ell \dot{\theta} \cos \theta)^2 + \frac{1}{2} m (\ell \dot{\theta} \sin \theta)^2 + m g \ell \cos \theta$$

$$L = \frac{1}{2} m [v_0^2 + a^2 t^2 + \ell^2 \dot{\theta}^2 + 2 v_0 a t + 2 v_0 \ell \dot{\theta} \cos \theta + 2 a t \ell \dot{\theta} \sin \theta] + m g \ell \cos \theta$$

$T + U \neq \text{constant}$  and  $H \neq T + U$

Again  $H = \sum_j p_j \dot{q}_j - L$

$$p_j = \frac{\partial L}{\partial \dot{q}_j} \quad \dot{p}_j = \frac{\partial L}{\partial q_j}$$

go from  $q_j, \dot{q}_j$   
to  $p_j, \dot{p}_j$

Now  $H(q_k, p_k, t) = \sum_j p_j \dot{q}_j - L(q_k, \dot{q}_k, t)$  essentially  $x, v_x$  to  $x, p_x$

A  $dH = \sum_k \left( \frac{\partial H}{\partial q_k} dq_k + \frac{\partial H}{\partial p_k} dp_k \right) + \frac{\partial H}{\partial t} dt$

$$dH = d \left[ \sum_j p_j \dot{q}_j - L \right] = \sum_k \left( \dot{q}_k dp_k + p_k d\dot{q}_k - \frac{\partial L}{\partial q_k} dq_k - \frac{\partial L}{\partial \dot{q}_k} d\dot{q}_k \right) - \frac{\partial L}{\partial t} dt$$

$p_k d\dot{q}_k = \frac{\partial L}{\partial \dot{q}_k} d\dot{q}_k$  so  $2+4=0$

Then  $\sum_k \left( \frac{\partial H}{\partial q_k} dq_k + \frac{\partial H}{\partial p_k} dp_k \right) + \frac{\partial H}{\partial t} dt = \sum_k \left( \dot{q}_k dp_k - \frac{\partial L}{\partial q_k} dq_k \right) - \frac{\partial L}{\partial t} dt = dH$

Then  $\frac{\partial H}{\partial t} = -\frac{\partial L}{\partial t}$   $\frac{\partial L}{\partial p_k} = \dot{q}_k$

$1=4$  or  $\frac{\partial H}{\partial q_k} = -\dot{p}_k$  and  $2=3$   $\frac{\partial H}{\partial p_k} = \dot{q}_k$

and  $\frac{dH}{dt} = \sum_k \left( -\dot{p}_k \frac{dq_k}{dt} + \dot{q}_k \frac{dp_k}{dt} \right) + \frac{\partial H}{\partial t} = \frac{\partial H}{\partial t}$

See A

# Prescription

$$1: p_j = \frac{\partial L}{\partial \dot{q}_j}$$

$$2: H = \sum_j p_j \dot{q}_j - L \quad \text{Hamiltonian}$$

3:  $\rightarrow$  Write  $H$

$$4: \left[ \begin{array}{l} \dot{q}_k = \frac{\partial H}{\partial p_k} \\ -\dot{p}_k = \frac{\partial H}{\partial q_k} \end{array} \right] \quad \text{Hamilton's eq's}$$

Parabolic Motion

$$d\vec{s} = dx\vec{i} + dy\vec{j}$$

$$T = \frac{1}{2}m\dot{x}^2 + \frac{1}{2}m\dot{y}^2$$

$$U = mgy$$

$$L = \frac{1}{2}m\dot{x}^2 + \frac{1}{2}m\dot{y}^2 - mgy$$

$$\frac{\partial L}{\partial \dot{x}} = m\dot{x} = p_x \quad \frac{\partial L}{\partial \dot{y}} = p_y$$

$$\dot{x} p_x = m\dot{x}^2 = \frac{m^2 \dot{x}^2}{m} = \frac{p_x^2}{m}$$

$$\dot{y} p_y = m\dot{y}^2 = \frac{m^2 \dot{y}^2}{m} = \frac{p_y^2}{m}$$

$$H = \frac{p_x^2}{m} + \frac{p_y^2}{m} - \left( \frac{p_x^2}{2m} + \frac{p_y^2}{2m} - mgy \right) = \frac{p_x^2 + p_y^2}{2m} + mgy = T + U$$

$$\text{Now } \frac{p_x^2}{2m} + \frac{p_y^2}{2m} + mgy = H$$

$$\text{Now } \frac{\partial H}{\partial p_x} = \frac{p_x}{m} = \dot{x} \quad \frac{\partial H}{\partial x} = 0 = -\dot{p}_x = -\frac{dp_x}{dt} = -\vec{F}_x = 0$$

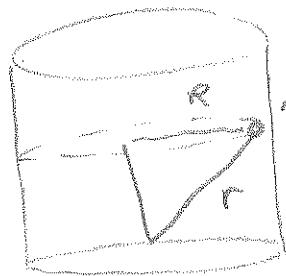

$$\frac{\partial H}{\partial p_y} = \frac{p_y}{m} = \dot{y} \quad \frac{\partial H}{\partial y} = mg = -\dot{p}_y = -\vec{F}_y \rightarrow \vec{F}_y = -mg$$

$$\text{Or } m \frac{dx}{dt} = p_x \quad \text{and } m \frac{dy}{dt} = p_y$$

$$\vec{F}_x = 0$$

$$\vec{F}_y = -mg$$

Ex. particle on

$$R^2 = x^2 + y^2$$

$$\vec{F} = -kr \hat{r}$$

$$U = \frac{1}{2} k r^2 = \frac{1}{2} k (x^2 + y^2 + z^2) = \frac{1}{2} k (R^2 + z^2)$$

$$T \text{ from } ds = dr \hat{r} + r d\theta \hat{\theta} + dz \hat{z} = \frac{1}{2} m (\dot{R}^2 + R^2 \dot{\theta}^2 + \dot{z}^2)$$

$$T = \frac{1}{2} m (R^2 \dot{\theta}^2 + \dot{z}^2)$$

$$L = \frac{1}{2} m (R^2 \dot{\theta}^2 + \dot{z}^2) - \frac{1}{2} k (R^2 + z^2)$$

$$P_\theta = \frac{\partial L}{\partial \dot{\theta}} = mR^2 \dot{\theta} \quad P_z = \frac{\partial L}{\partial \dot{z}} = m\dot{z}$$

$$\frac{1}{mR^2} P_\theta = \dot{\theta} \quad \dot{z} = \frac{P_z}{m}$$

$$P_\theta \dot{\theta} = \frac{P_\theta^2}{mR^2} \quad P_z \dot{z} = \frac{P_z^2}{m}$$

$$H = \frac{P_\theta^2}{mR^2} + \frac{P_z^2}{m} - \left( \frac{P_\theta^2}{2mR^2} + \frac{P_z^2}{2m} \right) + \frac{1}{2} k(R^2 + z^2)$$

$$H = \frac{P_\theta^2}{2mR^2} + \frac{P_z^2}{2m} + \frac{1}{2} k(R^2 + z^2)$$

$$\dot{\theta} = \frac{\partial H}{\partial P_\theta} = \frac{P_\theta}{mR^2} \quad \dot{P}_\theta = -\frac{\partial H}{\partial \theta} = 0$$

$$\dot{z} = \frac{\partial H}{\partial P_z} = \frac{P_z}{m} \quad \dot{P}_z = -\frac{\partial H}{\partial z} = -kz$$

$$P_z = m\dot{z} \quad \dot{P}_z = -kz \rightarrow m\ddot{z} = -kz \quad \ddot{z} + \frac{k}{m}z = 0$$

$$z(\tau) = A \cos\left(\sqrt{\frac{k}{m}} \tau\right) + B \sin\left(\sqrt{\frac{k}{m}} \tau\right)$$
