Second Midterm Exam

Colorado Mesa University · 2026 Fall

NAME: _____

1. Consider the function f defined by the formula $f(x) = -x^2 + 6x - 8$.

- (a) What is the x -coordinate of the vertex of the graph of f ?
- (b) What is the largest (maximum) possible output value of f ?
- (c) What is the y -coordinate of the y -intercept of the graph of f ?
- (d) On what interval(s) of its domain is $f(x)$ increasing?
- (e) On what interval(s) of its domain is $f(x)$ positive?

2. The function f defined by the formula below is a one-to-one function. Write down a formula for its inverse function f^{-1} .

$$f(x) = \sqrt[5]{3 - \frac{1}{2}x}$$

3. Below is the graph of a piecewise-defined function f . One component of the function is quadratic, and the other is a power function. Write down a piecewise-defined formula for $f(x)$.

4. The future value S after t years of an initial balance of P dollars invested at an annual interest rate r is given by the formula $S = P(1 + r)^t$. Solve this formula for r in terms of the other variables.

5. Suppose you are on a space station orbiting the planet Uranus. Bored, you are playing with a small rock. You toss the rock straight up into the air. The altitude (height) of the rock above you, in feet, measured x seconds after you throw it can be modelled by the function $A(x) = 5.45 + 19.4x - 14.55x^2$.

(a) Demonstrate how to calculate the time x at which the rock reaches its highest altitude (apex).

(b) Supposing you don't catch the rock on its way down, demonstrate how to calculate the time x at which the rock hits the ground.

6. Here is data for the population of Mesa County for select decades.

Year	2020	2010	2000	1990	1980	1970	1960	1950	1940
Population (in thousands)	155.7	146.7	116.3	93.1	81.5	54.7	50.7	38.8	33.8

From https://en.wikipedia.org/wiki/Mesa_County,_Colorado.

- (a) Perform regression to determine the *quadratic* function and the *power* function that best model this data, where the independent variable is measured in “years since 1900.” Write down the formulas for your models with parameters rounded to two non-zero decimal digits.
- (b) The *quadratic* model indicates Mesa County’s population is increasing, but how is the rate of increasing changing? Is it increasing or decreasing? I.e. Is the population’s growth accelerating or decelerating? What parameter in the model’s formula indicates this?
- (c) (EXTRAPOLATE) Assuming the *power* model remains accurate beyond the domain of the data, what does it estimate the current population of Mesa County to be?
- (d) (EXTRAPOLATE) Assuming the *power* model remains accurate beyond the domain of the data, what year will the population of Mesa County first exceed two hundred thousand? Demonstrate how to manually calculate this from the formula for the power model.
